Part I

The Double Paradigm

Double Categories

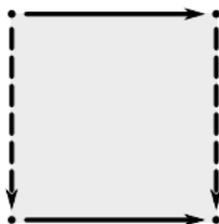

Definition

A (small) **double category** is an internal category in Cat.

Definition

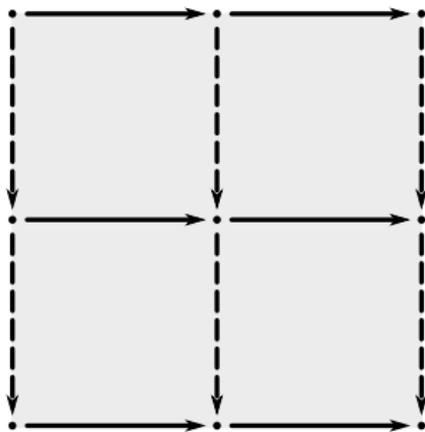

A (small) **double category** is an internal category in Cat.

A general element in a double category is a square :

And it composes associatively in two directions, with two different units.

Moreover the two compositions interchange , i.e. the following diagram has a unique composition :

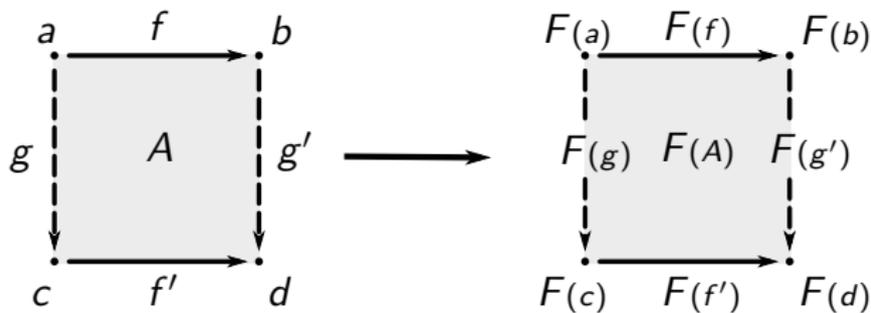

Double Functors

Definition

A **double functor** is an internal functor in Cat

It maps squares to squares respecting boundaries, units and composition.

Double Natural Transformations

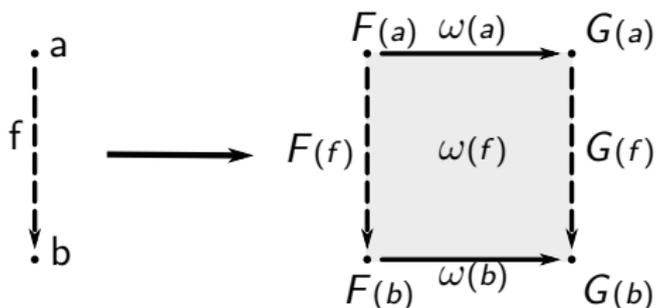

Definition

A **horizontal double natural transformation** is an *internal natural transformation* in Cat

Definition

A **horizontal double natural transformation** is an internal natural transformation in Cat

It associates squares to vertical morphisms :

In such a way that it intertwines functors horizontally :

$$\begin{array}{ccccc}
 F(a) & \xrightarrow{F(h)} & F(c) & \xrightarrow{\omega(c)} & G(c) \\
 \downarrow F(f) & & \downarrow F(g) & & \downarrow G(g) \\
 F(b) & \xrightarrow{F(k)} & F(d) & \xrightarrow{\omega(d)} & G(d)
 \end{array}
 =
 \begin{array}{ccccc}
 F(a) & \xrightarrow{\omega(c)} & G(a) & \xrightarrow{G(h)} & G(c) \\
 \downarrow F(f) & & \downarrow G(f) & & \downarrow G(g) \\
 F(b) & \xrightarrow{\omega(b)} & G(d) & \xrightarrow{G(k)} & G(d)
 \end{array}$$

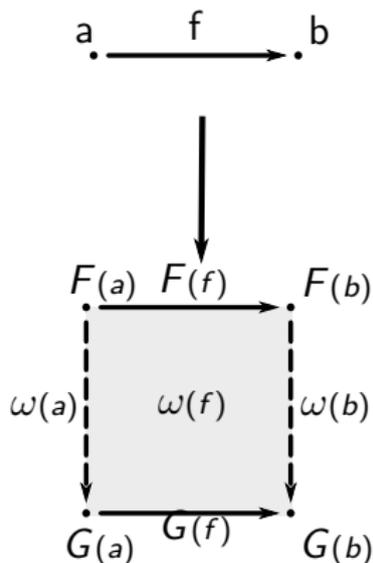

Definition

A **vertical double natural transformation** is an *internal natural cell* in Cat

Definition

A **vertical double natural transformation** is an internal natural cell in \mathbf{Cat}

It associates squares to horizontal morphisms :

In such a way that it intertwines functors vertically :

$$\begin{array}{ccc}
 F(a) & \xrightarrow{F(f)} & F(a) \\
 \downarrow F(k) & & \downarrow F(h) \\
 F(d) & \xrightarrow{F(g)} & F(c) \\
 \downarrow \omega(d) & & \downarrow \omega(c) \\
 G(d) & \xrightarrow{G(g)} & G(c)
 \end{array}
 =
 \begin{array}{ccc}
 F(b) & \xrightarrow{F(f)} & F(a) \\
 \downarrow \omega(b) & & \downarrow \omega(c) \\
 G(d) & \xrightarrow{G(f)} & G(a) \\
 \downarrow G(k) & & \downarrow G(h) \\
 G(d) & \xrightarrow{G(g)} & G(c)
 \end{array}$$

Double Comparison

Definition

A **double comparison** is an internal comparison in Cat.

Definition

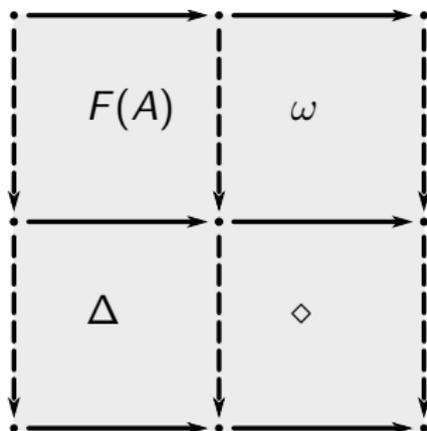

A **double comparison** is an internal comparison in Cat.

It associates squares to objects :

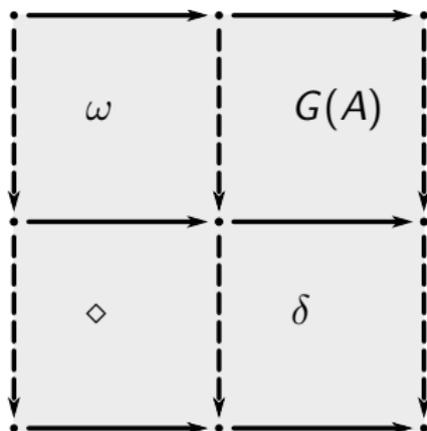

$$\begin{array}{c}
 \bullet a \longrightarrow \Delta(a) \longrightarrow \begin{array}{ccc}
 F(a) & \xrightarrow{\omega(a)} & G(a) \\
 \vdots & & \vdots \\
 J(a) & \xrightarrow{\Omega(a)} & H(a)
 \end{array}
 \end{array}$$

$\Delta(a)$ is a square with vertices $F(a)$, $G(a)$, $J(a)$, $H(a)$. The top edge is $\omega(a)$, the bottom edge is $\Omega(a)$, the left edge is $\Delta(a)$, and the right edge is $\delta(a)$. The center of the square is labeled $\diamond(a)$.

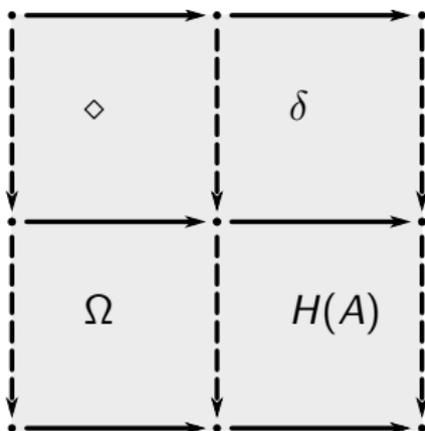

In such a way that all the following are equal :

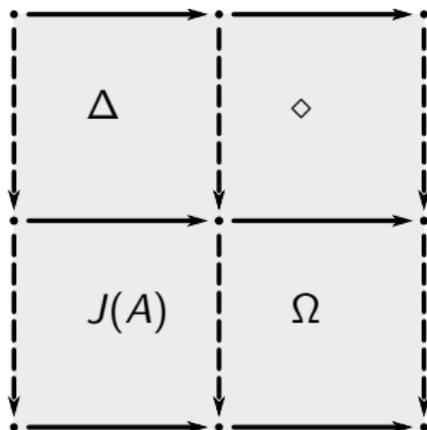

In such a way that all the following are equal :

In such a way that all the following are equal :

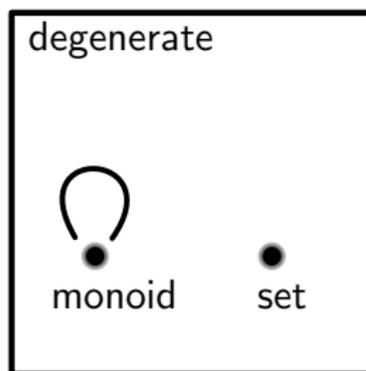

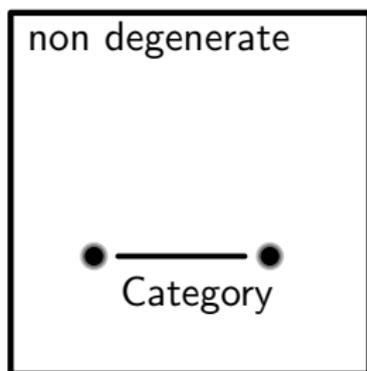

In such a way that all the following are equal :

Degeneracies

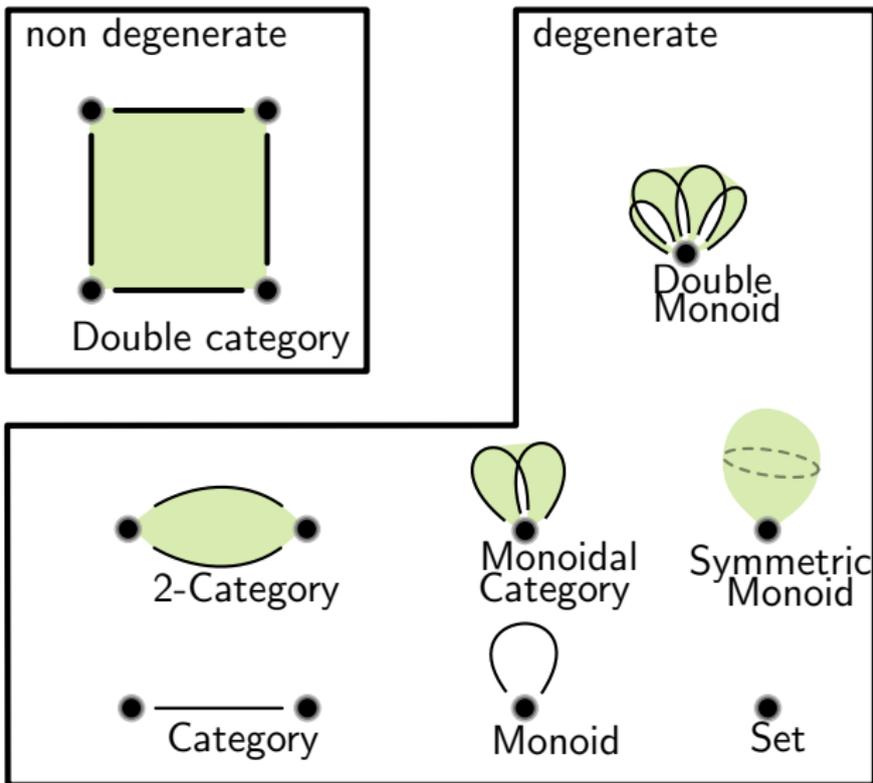

As there are 2 degenerate versions of a segment, there are 2 degenerate forms of categories :

As there are 2 degenerate versions of a segment, there are 2 degenerate forms of categories :

As there are 7 degenerate squares, there are 7 degenerate forms of double categories, only 4 of which are new :

As there are 7 degenerate squares, there are 7 degenerate forms of double categories, only 4 of which are new :

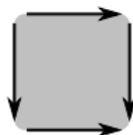

Part II

The Structure of Double Groups

Definition

A **double groupoid** is a (strict) double category where every square has both horizontal and vertical inverses. A **double group** is a double groupoid with a single object.

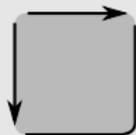

To save time and space, we will from now on not draw the objects :

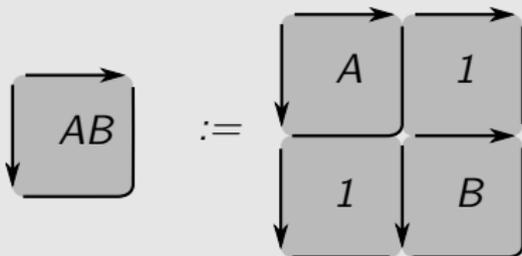

The Core

Definition

The **core groupoid** τ_{\downarrow} of a double groupoid τ is the diagonal groupoid of elements of τ whose targets are identities. These are squares of the form :

whose multiplication is defined by :

Definition

The **core bundle** τ_\bullet of a double groupoid τ is the sub groupoid of τ_\sqcup whose boundaries are all identities. It is a group bundle over the objects whose elements are squares are of the form :

Lemma

The core bundle of a double groupoid is an abelian group bundle over its objects.

Proof.

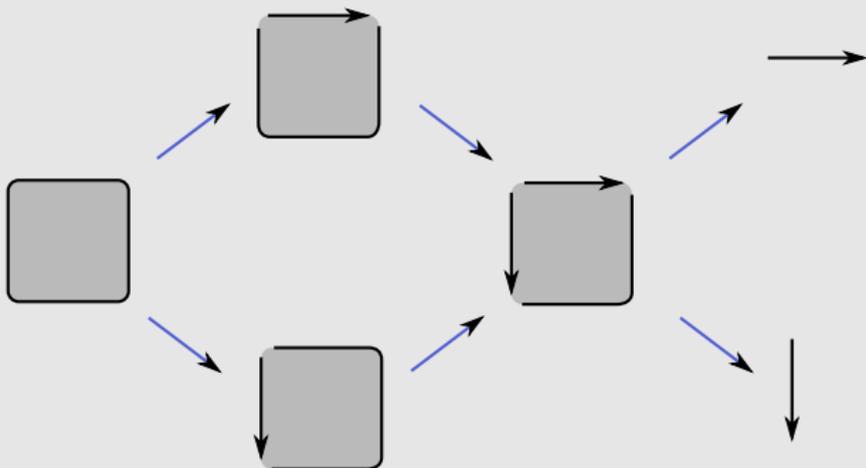

This is the celebrated Eckmann-Hilton argument, which goes as follows :

$$\begin{array}{c}
 \begin{array}{|c|c|} \hline A & B \\ \hline \end{array} \\
 = \\
 \begin{array}{|c|c|} \hline A & 1 \\ \hline \hline 1 & B \\ \hline \end{array} \\
 = \\
 \begin{array}{|c|} \hline A \\ \hline \hline B \\ \hline \end{array} \\
 = \\
 \begin{array}{|c|c|} \hline 1 & A \\ \hline \hline B & 1 \\ \hline \end{array} \\
 = \\
 \begin{array}{|c|c|} \hline B & A \\ \hline \end{array}
 \end{array}$$

Definition

The **core diagram** of a double groupoid is the following diagram of groupoids :

Definition

A double groupoid is **slim** if its core bundle is the trivial bundle. It is **exclusive** if its core groupoid is equal to its core bundle.

Slim double groupoids have at most one square per boundary condition, as the following lemma shows :

Lemma

Let τ be a double groupoid, $X, Y \in \tau$ with the same boundary. Then there exist a unique element $u_{X,Y}$ in the core bundle of τ such that :

$$\begin{array}{|c|} \hline X \\ \hline \end{array} := \begin{array}{|c|c|} \hline u_{X,Y} & 1 \\ \hline 1 & Y \\ \hline \end{array}$$

Proof.

Defining $u_{X,Y}$ by :

$$\boxed{u_{X,Y}} \quad := \quad \begin{array}{ccc}
 & \xrightarrow{\quad} & \\
 f \downarrow & \boxed{X} & \xrightarrow{\quad} \boxed{Y^{-h}} & \downarrow f \\
 & \xrightarrow{\quad} & \\
 f^{-1} \downarrow & \boxed{id_{f^{-1}}} & \downarrow f^{-1} & \\
 & \xrightarrow{\quad} &
 \end{array}$$

and using inverses to isolate X yields the claim. □

Exclusive double groupoids have their boundary fixed by the knowledge of one of its horizontal and one of its vertical component, as shows the following lemma shows :

Lemma

Let τ be a double groupoid, $X, Y \in \tau$ with the same targets. Then there exist a unique element $t_{X,Y}$ in the core groupoid of τ such that :

$$\begin{array}{c} \begin{array}{|c|} \hline \begin{array}{c} \xrightarrow{\quad} \\ \boxed{X} \\ \xleftarrow{\quad} \end{array} \\ \hline \end{array} \begin{array}{c} \xrightarrow{\quad} \\ \xrightarrow{g} \\ \xleftarrow{\quad} \end{array} := \begin{array}{|c|c|} \hline \begin{array}{c} \xrightarrow{\quad} \\ \boxed{t_{X,Y}} \\ \xleftarrow{\quad} \end{array} & \begin{array}{c} \xrightarrow{\quad} \\ \boxed{1} \\ \xleftarrow{\quad} \end{array} \\ \hline \begin{array}{c} \xrightarrow{\quad} \\ \boxed{1} \\ \xleftarrow{\quad} \end{array} & \begin{array}{c} \xrightarrow{\quad} \\ \boxed{Y} \\ \xleftarrow{\quad} \end{array} \\ \hline \end{array} \begin{array}{c} \xrightarrow{\quad} \\ \xrightarrow{g} \\ \xleftarrow{\quad} \end{array} \\ \begin{array}{|c|} \hline \begin{array}{c} \xrightarrow{\quad} \\ \boxed{f} \\ \xleftarrow{\quad} \end{array} \\ \hline \end{array} \end{array}$$

Proof.

Defining $t_{X,Y}$ by :

$$\begin{array}{c}
 \boxed{t_{X,Y}} \\
 \hline
 := \begin{array}{c}
 \begin{array}{ccc}
 \xrightarrow{\quad} & & \xrightarrow{\quad} \\
 \downarrow h & \boxed{X} & \downarrow Y^{-h} \\
 \xrightarrow{\quad} & & \xrightarrow{\quad} \\
 \downarrow k^{-1} & \boxed{id_{k^{-1}}} & \downarrow k^{-1} \\
 \xrightarrow{\quad} & & \xrightarrow{\quad}
 \end{array}
 \end{array}
 \end{array}$$

and using inverses to isolate X yields the claim. □

Bicrossed products

When both conditions are present, a familiar structure of group is recovered : bicrossed products.

Theorem (Andruskiewitsch Natale '09)

Maximal, slim and exclusive double groups are equivalent to bicrossed products of groups.

Let's recall what the bicrossed product of groups is :

Definition

Let H and K be groups, then a bicrossed product $H \bowtie K$ is a group defined on the set $H \times K$ by the following multiplication :

$$(h, k)(h', k') = (h(k \triangleright h'), k^h k')$$

where \triangleright is a left action of K on H and $(\)^K$ is a right action of H on K such that :

$$k \triangleright (hh') = (k \triangleright h)(k^h \triangleright h')$$

$$(kk')^h = k^{k' \triangleright h} k'^h$$

$$k \triangleright 1 = 1$$

$$1^h = 1$$

Other names for the bicrossed products of groups are :
 knit product, Zappa-Szep product or matched pairs of groups.
 They emerge in the following situations:

Lemma

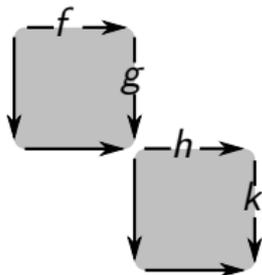

Let H and K be subgroups of G such that every element $g \in G$ can be uniquely written as :

$$g = hk$$

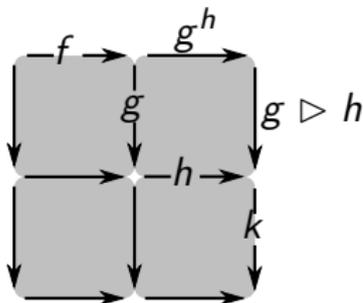

Then there exist a bicrossed product on $H \times K$ such that

$$G \simeq H \bowtie K$$

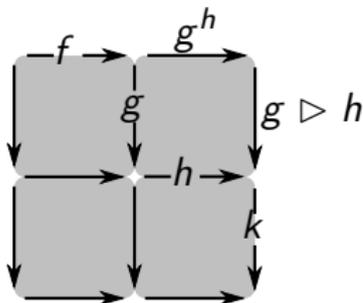

In the case that every pair of arrows sharing a corner bound a square (maximality), then a diagonal groupoid exists, given by :

In the case that every pair of arrows sharing a corner bound a square (maximality), then a diagonal groupoid exists, given by :

In the case that every pair of arrows sharing a corner bound a square (maximality), then a diagonal groupoid exists, given by :

which is the bicrossed product, with conditions given by (for the right action):

$$\begin{array}{c} | \\ g \\ \downarrow \\ \text{---} \end{array} \quad \text{and} \quad \begin{array}{c} | \\ g \\ \downarrow \\ \text{---}h \rightarrow \text{---}h' \end{array}$$

Removing the assumption of being slim, we get :

Theorem (Majard '11)

Maximal exclusive double groups are equivalent to semi-direct products of an abelian group with a matched pair of groups.

Examples

The Poincaré Group

The first interesting example is the Poincaré Group. Indeed, the Iwasawa decomposition of $SO(3,1)$ tells us that

Lemma

The Poincaré group is isomorphic to the following group :

$$\text{Poinc} \simeq (SO(3) \ltimes (SO(1,1) \ltimes N)) \times \mathbb{R}_+^4$$

where :

$$N := \exp \left\{ \begin{bmatrix} 0 & 0 & a & b \\ 0 & 0 & a & b \\ a & -a & 0 & 0 \\ b & -b & 0 & 0 \end{bmatrix} \mid a, b \in \mathbb{R} \right\}$$

It therefore corresponds to a unique double group :

$$SO(1,1) \rtimes N \left[\begin{array}{c} \xrightarrow{SO(3)} \\ \mathbb{R}_+^4 \\ \xrightarrow{\quad} \end{array} \right]$$

Hyperplatonic solids

Another interesting connection is given by hyperplatonic solids, or platonic solids in 4 dimension. These are given by finite subgroups of $SO(4)$. Or $SU(2) \times SU(2)$ is a double cover of $SO(4)$

Part III

General Case

N -tuple Categories

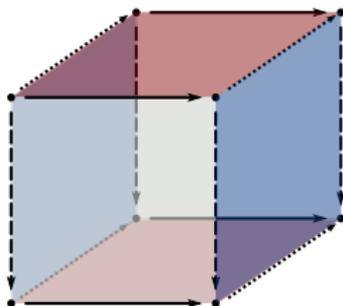

Definition

*An **n -tuple category** is an internal category in the category of $(n - 1)$ -tuple categories.*

Definition

An **n -tuple category** is an internal category in the category of $(n - 1)$ -tuple categories.

Its elements are n -cubes that compose associatively and with unit in all n directions and the interchange law is valid for any pair of directions.

Definition

An **n -tuple groupoid** is an n -tuple category whose n -cubes are invertible in all directions. An **n -tuple group** is an n -tuple groupoid on one object.

Definition

An ***n*-tuple groupoid** is an *n*-tuple category whose *n*-cubes are invertible in all directions. An ***n*-tuple group** is an *n*-tuple groupoid on one object.

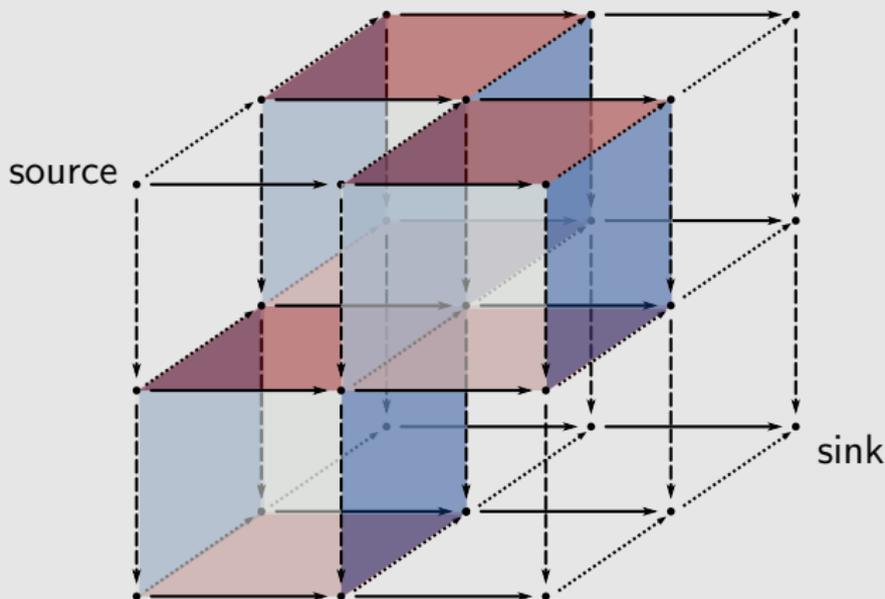

Definition

An arrangement of *n*-cubes combinatorially equivalent to the one given by excluding the subspaces $x_i = \frac{1}{2}$ for all $i \in [n]$ from $[0, 1]^n \subset \mathbb{R}^n$ is called a **barycentric subdivision** of the *n*-cube.

Depth

The **depth** of a cube in a barycentric division has to do with its position with respect to the source object.

For example, here are the cubes of depth 1 in a barycentric division of dimension 3.

The structure of n -tuple groups

Definition

Let τ be an *n*-tuple groupoid and define

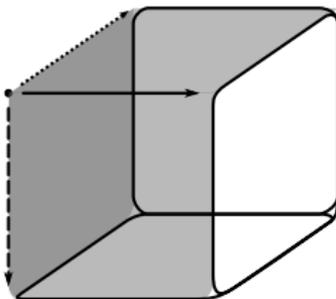

$$\begin{aligned} \tau_{\lrcorner} &:= \{n\text{-cubes whose recursive targets are identities}\} \\ &= \{X \in \tau \mid t_i(X) = v_i(t_{[n]}(X))\} \end{aligned}$$

Definition

Let τ be an *n*-tuple groupoid and define

$$\begin{aligned} \tau_{\lrcorner} &:= \{n\text{-cubes whose recursive targets are identities}\} \\ &= \{X \in \tau \mid t_i(X) = \iota_i(t_{[n]}(X))\} \end{aligned}$$

For example, in dimension 3:

Definition

For $u \in \tau_{\perp}$ and $X \in \tau$ such that $t_{[n]}(u) = s_{[n]}(X)$ define the **transmutation of X by u** , denoted $u \cdot X$, to be the n -cube accepting a barycentric subdivision with u of depth 0, X of depth n and all others identities, as defined above.

Definition

For $u \in \tau_{\perp}$ and $X \in \tau$ such that $t_{[n]}(u) = s_{[n]}(X)$ define the **transmutation of X by u** , denoted $u \cdot X$, to be the n -cube accepting a barycentric subdivision with u of depth 0, X of depth n and all others identities, as defined above.

Lemma

Let $u, v \in \tau_{\perp}$, then $u \cdot v \in \tau_{\perp}$. Moreover $(\tau_{\perp}, \cdot, \iota)$ is a groupoid, called the **core groupoid**.

Lemma

Let $X, Y \in \tau$ such that $t_i(X) = t_i(Y), \forall i$, then there exists a unique element $u_{XY} \in \tau_{\perp}$ such that

$$X = u_{XY} \cdot Y$$

Definition

Let τ_{\bullet} be the sub groupoid of τ_{\sqcup} composed of n -cubes whose boundaries are all identities. It is called the **core bundle**.

Definition

Let τ_\bullet be the sub groupoid of τ_\sqcup composed of *n*-cubes whose boundaries are all identities. It is called the **core bundle**.

Definition

A *n*-tuple groupoid is **slim** if its core bundle is trivial

Definition

Let τ_\bullet be the sub groupoid of τ_\sqcup composed of n -cubes whose boundaries are all identities. It is called the **core bundle**.

Definition

A n -tuple groupoid is **slim** if its core bundle is trivial

Corrolary

A n -tuple groupoid is **slim** iff there is at most one n -cube per boundary condition.

Definition

A n -tuple groupoid is **exclusive** if $\tau_{\lrcorner} = \tau_{\bullet}$.

Definition

A *n*-tuple groupoid is **exclusive** if $\tau_{\lrcorner} = \tau_{\bullet}$.

Corrolary

A *n*-tuple groupoid is exclusive if and only if the boundary of its *n*-cubes are determined by one of their boundaries of each type.

Definition

An n -tuple groupoid τ is **maximal** if for any (f_1, f_2, \dots, f_n) s.t. $f_i \in \tau_i$ and $t_i(f_i) = t_j(f_j) \quad \forall i, j \in \mathbb{Z}_n$ there exists $X \in \tau$ s.t.

$$s_{1 \dots (i-1)} t_{(i+1) \dots n}(X) = f_i$$

Definition

An n -tuple groupoid τ is **maximal** if for any (f_1, f_2, \dots, f_n) s.t. $f_i \in \tau_i$ and $t_i(f_i) = t_j(f_j) \quad \forall i, j \in \mathbb{Z}_n$ there exists $X \in \tau$ s.t.

$$s_{1 \dots (i-1)} t_{(i+1) \dots n}(X) = f_i$$

Definition

An n -tuple groupoid is **maximally exclusive** if

- all boundary i -tuple groupoids are slim for $i > 1$
- all boundary double groupoids are exclusive
- it is maximal

Theorem (Majard '11)

Maximally exclusive n -groups are equivalent to semi-direct products of an abelian group with an iterated bicrossed product of groups.

Theorem (Majard '11)

Maximally exclusive n -groups are equivalent to semi-direct products of an abelian group with an iterated bicrossed product of groups.

For example in dimension 3, groups of the form:

$$G \simeq (H_1 \bowtie H_2 \bowtie H_3) \ltimes A$$

Conclusion

Thank you !
